

scripts/firebase-stats.sh — User Guide

Last verified: 2026-05-15 (1.2.23 closure-cycle, §6.AD-debt task #61 backfill) **Inheritance:** HelixConstitution §11.4.18 (script documentation mandate)

Overview

Stub doc generated from the script's in-source header comment. See scripts/firebase-stats.sh for canonical behavior. This stub exists so the CM-SCRIPT-DOCS-SYNC pre-push gate (.github/hooks/pre-push Check 9) starts gating modifications to this script.

The script's own header documentation (verbatim):

```
scripts/firebase-stats.sh - pull Crashlytics + Analytics stats for
the
currently-released Lava Android build.
```

Reports on stdout:

- Crashlytics: fatal counts, non-fatal counts, top 5 issues by frequency
- Analytics: event counts for the canonical user-visible flow events (login, search, browse, view-topic, download-torrent)

Usage:

```
./scripts/firebase-stats.sh                # last 7 days
./scripts/firebase-stats.sh --days 30     # last 30 days
./scripts/firebase-stats.sh --json         # machine-
readable output
```

Note (2026-05-05): Firebase CLI does not expose Crashlytics/Analytics query endpoints directly. This script prints the dashboard URLs for the operator + uses `gcloud` (if available) to pull aggregate Cloud Logging counts as a non-bluff signal that the integration is reporting. When richer queries are needed, the lava-api-go service will gain a /admin/firebase-stats

endpoint backed by the Firebase Admin SDK (see `internal/firebase/`).

Constitutional bindings:

§6.J Anti-Bluff – script doesn't pretend to query a non-existent CLI

endpoint; it surfaces the dashboard URL + the partial signals

it CAN provide.

§6.H Credential Security – token never logged.

Usage

See the script's in-source comment block (above) for canonical usage examples.

Maintenance

When this script is modified, update this document in the same commit (CM-SCRIPT-DOCS-SYNC requires it). Per §11.4.18, the documentation MUST stay in sync with the codebase — no doc may be out of sync with its script.
