

Release-variant full live-testing pass — Lava-Android-1.3.17-1087 + Lava-API-App-0.2.13-28

Date: 2026-09-23 **Purpose:** operator directive to perform "full LIVE testing on booted emulators using Containers Submodule" as the real-device-equivalent (per this project's own §6.I) before proceeding to §6.AA Stage 2 (release) Firebase distribution, since a literal physical-device confirmation was not practical in this environment.

Scope

Substantially broader than the previous cycle's minimum: 11 client Challenges + all 7 api-app Challenges, run against BOTH the debug and the R8-minified releaseTest build types, on a containerized KVM emulator (CZ_API34_Phone, API 34, phone).

Real defects found and fixed this pass

- 1. `androidx.compose.ui.test.testManifest` was `debugImplementation-only` in both `app/build.gradle.kts` and `api-app/build.gradle.kts`.**
Since `releaseTest` is a distinct build type from `debug`, it never inherited this dependency, so any Challenge using the isolated `createComposeRule()` pattern (e.g. Challenge07/08) failed with `Unable to resolve activity for ... ComponentActivity`. Fixed by adding a matching `releaseTestImplementation` declaration in both files. A follow-up audit (dedicated subagent, read-only) confirmed this was the *only* `debugImplementation` dependency either `app` needed for `androidTest` — the one other candidate (`LeakCanary`) is genuinely unused by any `androidTest` code.
- 2. Investigated a serious-looking finding down to ground truth via direct `dexdump` inspection of the actual signed release APK,** matching this project's own LVA-098-incident methodology: `CrossTrackerFallbackModalKt` (a production Composable) was absent from the release APK's dex files. Confirmed via targeted dex

searches that the SDK layer (CrossTrackerFallbackPolicy, SearchOutcome\$CrossTrackerFallbackProposed), the network layer (SwitchingNetworkApi), and — critically — the ViewModel layer (SearchResultViewModel\$onFallbackAccept\$1/\$onFallbackDismiss\$1) and SearchPageState were ALL present and reachable in the real release dex. Conclusion: R8's isOptimizeCode legitimately inlined this small, single-call-site composable into its caller (SearchResultScreenKt) — a correct optimization, not a stripped/broken feature. Real users hit the working inlined code path through the normal SearchResultScreen navigation flow. Added a targeted -keep rule so the isolated component test (a legitimate test pattern, calling the reusable composable directly rather than through full navigation) has a stable class to reference. This is NOT a product defect fix — the feature was never broken for real users; only the isolated test's ability to name the class was affected.

Client (:app)

Challenge	debug	releaseTest	Notes
C00 CrashSurvival	PASS	PASS	rotated-auth
C01 AppLaunch	—	PASS	
C02 AuthenticatedSearch (RuTracker)	—	PASS (isolated re-run)	transient de hiccup in a c run, clean P isolation
C03 AnonymousSearch (RuTor)	—	PASS	
C04 ProviderRowOpensConfig	—	PASS	
C05 ViewTopicDetail	FAIL (both variants, identical timeout)	FAIL	confirmed N specific — sa ComposeTime after 45000r too. Real-net dependent t consistent w project's alre documented Cloudflare/tr

Challenge	debug	releaseTest	Notes
			reachability not a code re Not blocking
C06 DownloadTorrentFile	(different failure mode on debug: No compose hierarchies found, likely cascading from a prior test's app-state corruption in the same session)	FAIL (ComposeTimeoutException)	same real-no dependency not a release regression
C07 CrossTrackerFallbackAccept	—	PASS (after fix)	both sub-tes
C08 CrossTrackerFallbackDismiss	—	PASS (after fix)	both sub-tes
C13 FirebaseColdStartResilience	—	PASS	
C15 AuthInterceptorBoot	—	PASS	

api-app (:api-app)

Challenge	debug	releaseTest
C01 ColdStart	PASS	PASS
C02 BootAndServe	PASS	PASS
C03 StopRestart	PASS	PASS
C04 NotificationActions	PASS	PASS
C05 EmbedSourceHashMatches	—	PASS
C06 CopyKey	—	PASS
C07 OpenClient	—	FAIL — confirmed via git log + prior CHANGELOG entries (0.2.12-24, 0.2.12-25) that this is the SAME pre-existing test-automation limitation (F5: "the

Challenge	debug	releaseTest
		api-app's Compose 'Back to Lava client' button resists UiAutomator clicks — a test-automation limitation, NOT a product defect"), unchanged since the test was authored (d5694551). Not a new regression, not blocking.

Verdict

6/7 api-app Challenges genuinely pass on the release-shaped build; the 1 failure is a confirmed pre-existing, documented, non-product limitation. 9/11 client Challenges genuinely pass (including the two just fixed this pass); the 2 failures are confirmed NOT release-variant-specific (identical failure on debug) and consistent with this project's already-documented external tracker-reachability condition. No product regression found in this cycle's actual functional content (the lava-api-go 2.3.35 fix + the release-testing infrastructure itself) across either app.

Real client release APK (rebuilt with the CrossTrackerFallbackModal keep rule): SHA-256

8663e116cd8b9989ebf5ad698a2cd7a7401ce3388e30b023aba401b17b641b65, v1+v2 signed, CN=Lava Release, O=Lava, C=RS. api-app's release APK is unaffected by this round's fixes (both were androidTest-classpath-only changes) — SHA-256 unchanged from the prior record: 76f97d3664fe429c7edce795496261fa8755f30c77d3769f0a4b10e32a770211.
