

scripts/check-no-nested-own-org-submodules.sh — User Guide

Last verified: 2026-05-15 (constitution-compliance plan Phase 5) **Inheritance:** HelixConstitution §11.4.28 (Submodules-As-Equal-Codebase) + §11.4.18 (script docs)

Overview

Enforces §11.4.28: an owned-by-us submodule MUST NOT itself contain another own-org submodule as a nested entry. Chains like vasic-digital/Lava → vasic-digital/Challenges → vasic-digital/Panoptic are forbidden — they create transitive-ownership opacity, frustrate independent peer development, and silently couple component lifecycles that §11.4.28 demands be peers.

Forbidden orgs

The OWN-ORG set (any of these orgs as a nested submodule's host org triggers a violation):

- vasic-digital
- HelixDevelopment
- red-elf
- ATM0Sphere1234321
- Bear-Suite
- Boat0S123456
- Helix-Flow
- Helix-Track
- Server-Factory

Both github.com: and gitlab.com: URL forms are matched.

Modes

Flag	Behavior
--strict (default)	Exit 1 on any violation
--advisory	Exit 0 even on violation
LAVA_NESTED_OWN_ORG_STRICT=0 env	Same as --advisory

Resolution paths

When a violation is reported, two resolution paths exist:

1. **Refactor (preferred):** Extract the nested submodule to be a peer of the container. Example: move submodules/challenges/Panoptic to submodules/Panoptic (parent-level peer of submodules/challenges). Both submodules then load independently from the parent project's .gitmodules.
2. **Waiver:** Add an entry to the WAIVERS=() array at the top of the scanner. Each waiver **MUST** cite:
 - WHY the nesting exists (legacy coupling, hard infrastructure dependency, etc.)
 - Tracking issue or commit referencing the planned refactor
 - Target removal date or "permanent" if structurally required

Usage

```
bash scripts/check-no-nested-own-org-submodules.sh
# strict (default)
bash scripts/check-no-nested-own-org-submodules.sh --advisory
# exit 0 even on violation
LAVA_NESTED_OWN_ORG_STRICT=0 bash scripts/check-no-nested-own-org-
submodules.sh # env-driven
```

Hermetic test

tests/check-constitution/test_nested_own_org_submodules.sh — 4 fixtures:

- test_clean_fixture_passes — synthetic submodules/foo/ pointing to nlohmann/json (third-party org) → exits 0
- test_vasic_digital_chain_rejected — synthetic vasic-digital chain → exits 1 with violation
- test_helix_dev_gitlab_chain_rejected — HelixDevelopment via gitlab → exits 1 with violation
- test_advisory_mode_returns_zero — advisory mode swallows exit code

Known violations (2026-05-15 audit)

Container	Nested path	Forbidden URL	Status
submodules/challenges	Panoptic	git@github.com:vasic-digital/Panoptic.git	OPEN — refactor owed

The Challenges/Panoptic chain pre-dates §11.4.28 (the clause was added 2026-05-15). Resolution is owed in a follow-up cycle: extract Panoptic to be submodules/Panoptic (parent-level peer of Challenges), update both projects' .gitmodules, propagate the rename through any references in the Challenges submodule's code.
