

scripts/commit_all.sh — User Guide

Last verified: 2026-05-14 (1.2.23 cycle) **Inheritance:** HelixConstitution §11.4.18 (script documentation mandate) + §11.4.22 (lightweight commit path) + Lava §6.AD (HelixConstitution Inheritance) + §6.W (GitHub + GitLab only mirror policy)

Overview

Project-official commit + multi-mirror-push wrapper for the Lava parent repository. HelixConstitution mandates a project commit wrapper (CLAUDE.md "MANDATORY COMMIT & PUSH CONSTRAINTS"); Lava's wrapper is scoped to the §6.W 2-mirror set (GitHub + GitLab) and refuses destructive operations without explicit per-operation operator authorization per §9.

This is the **lightweight path** for routine commits. The wrapper:

1. Stages files (all-tracked or explicit `--files` list)
2. Commits with the supplied message
3. Pushes to every configured GitHub + GitLab named remote (github, gitlab)
4. Verifies §6.C convergence (every mirror's HEAD matches local HEAD)
5. Reports diagnostics on failure

Prerequisites

- `git` $\geq$ 2.30 in PATH
- Local clone with at least one of: github, gitlab named remotes (use `git remote add github git@github.com:...`)
- `core.hooksPath` set to `.githooks` (one-time per clone): `git config core.hooksPath .githooks`
- For commits that touch test files / gate-shaping files: a `Bluff-Audit:` stamp in the commit message body per Seventh Law clause 1 + §6.N.1.2
- For commits that add a new constitutional clause (##### 6.X in CLAUDE.md): a `Classification:` line per HelixConstitution §11.4.17

Usage

Basic commit + push (all tracked changes)

```
scripts/commit_all.sh -m "fix(feature): one-line summary"
```

Stages every modified + new tracked file, commits, pushes to GitHub + GitLab.

Commit specific files only

```
scripts/commit_all.sh -m "docs: update CONTINUATION" --files docs/  
CONTINUATION.md
```

Stages ONLY the listed files (no `git add -A` global add). Useful when:

- Multiple unrelated changes are in the working tree but only one belongs in this commit
- Submodules are nested-dirty but the parent change should not bump pins
- Large doc edits should not pull in stray test changes

Commit without push

```
scripts/commit_all.sh -m "wip: experimenting" --no-push
```

Useful for staging WIP commits that are not yet ready to share.

Diagnostic mode

```
scripts/commit_all.sh --status
```

Reports the repo path, branch, HEAD SHA, configured remotes, and a list of dirty files (first 20). Does NOT modify state.

Amend (operator-authorized only)

```
scripts/commit_all.sh --amend
```

REJECTED with exit code 5. Per HelixConstitution §9 absolute-data-safety, destructive operations (history rewrite, force-push, branch deletion) require explicit per-operation operator authorization. The wrapper's standing rule: NO amend. If genuinely needed, the operator runs `git commit --amend` directly after backing up `.git`.

Inputs

Argument	Required?	Description
<code>-m, --message <msg></code>	yes (unless <code>--status</code>)	Commit message body
<code>--files <f1> <f2> ...</code>	no	Stage only the listed paths (default: stage all tracked changes)
<code>--no-push</code>	no	Skip push; commit only
<code>--amend</code>	no	Rejected with exit 5 (operator must use <code>git commit --amend</code> directly)
<code>--status</code>	no	

Argument	Required?	Description
		Diagnostic mode; reports state without modifying
-h, --help	no	Print usage and exit

Outputs

- Newly-created commit on local HEAD
- Push to every configured `github` + `gitlab` named remote
- §6.C convergence check report (✓ or ✗ per mirror)
- Exit code 0 on success

Exit codes

Code	Meaning
0	Committed + pushed (or committed only with <code>--no-push</code>)
1	Usage error (missing required arg)
2	Git operation failed (commit failed)
3	Nothing to commit (informational, not error)
4	Push failed for one or more mirrors
5	Operator confirmation required for destructive flag (<code>--amend</code>)

Side-effects

- Modifies index, HEAD, refs/heads/master (the active branch)
- Pushes to remote refs (this is destructive in the sense that it advances remote state; per §6.W only `github` + `gitlab` are touched)
- Triggers the pre-push hook (`.githooks/pre-push`) which runs Layer 1 (anti-bluff checks) + Layer 2 (`scripts/ci.sh --changed-only`)

Edge cases

Multiple remotes named `github` but pointing to different upstreams

The wrapper pushes to every remote named exactly `github` or `gitlab`. If you have additional named remotes (`upstream`, `origin` with mixed push URLs, `helixdevelopment-fork`, etc.), they are NOT pushed by the wrapper. Per §6.W, only `github` + `gitlab` are mandated mirrors for the Lava parent.

Submodules with nested-dirty state

If `submodules/X` shows `m` (lowercase, sub-submodule modified) in `git status`, the parent commit does NOT include the submodule unless explicitly listed in `--files`. This is intentional — pre-existing nested-dirty state should not silently advance the parent's pin.

Commit body includes `-- token`

Argument parsing stops `--files` consumption on the first token starting with `-` (single or double dash). Pass `-m BEFORE --files` to avoid the message being parsed as a file path.

Internal behaviour

The wrapper is intentionally thin (~180 lines). It does not:

- Run tests directly (Layer 2 of pre-push hook does that via `scripts/ci.sh --changed-only`)
- Regenerate auto-generated docs (HelixConstitution §11.4.12 — TODO §6.AD-debt for the export-regeneration pipeline integration)
- Handle submodule pin bumps (use direct `git submodule add / git add submodules/<name>` for those)

Related scripts

- `.githooks/pre-push` — invoked automatically on push; runs anti-bluff checks + `ci.sh`
- `scripts/ci.sh --changed-only` — Layer 2 pre-push gate (Spotless, changed-module unit tests, constitution parser, hermetic bash test suites)
- `scripts/check-constitution.sh` — invoked from `ci.sh`; verifies clauses 6.A through 6.AD + §6.W boundary + no-guessing vocabulary
- `scripts/firebase-distribute.sh` — release distribute (not invoked from `commit_all`)
- `scripts/inject-helix-inheritance-block.sh` — §6.AD-debt closure tool; idempotent inject of inheritance pointer-blocks
