

scripts/systemd-uninstall.sh — User Guide

Last verified: 2026-08-12 (initial version) **Inheritance:**
HelixConstitution §11.4.18 + Lava §6.U (No-sudo/su Mandate)

Overview

Reverses scripts/systemd-install.sh: stops the lava-api-go systemd --user unit if active, disables it, removes the rendered ~/.config/systemd/user/lava-api.service file, and reloads the systemd --user daemon. No sudo/su used or required.

Usage

```
./scripts/systemd-uninstall.sh
```

What it does NOT do

Does not run `loginctl disable-linger` — `linger` is an account-wide setting other --user units on the same machine may rely on, so this script leaves it untouched. Disable it manually if desired:

```
loginctl disable-linger
```

See docs/scripts/systemd-install.sh.md for the install-side counterpart.
