

Bugfixes — 2026-07-04 QA cycle (operator autonomous-loop)

Phase 1 evidence (server-side, before device matrix)

Go API (lava-api-go) probed directly on nezha (Linux x86_64, KVM, VPN egress):

Provider	Auth	/v1/{p}/search status	Root cause
gutenberg	NONE	200	works keyless (dual-stack upstream)
rutracker	CAPTCHA_LOGIN	200 WITH Auth-Token: rutracker:cookie:<bb_session> (401 without)	client must login→persist→provider session
kinozal	FORM_LOGIN	login 200 (server-side); search needs Auth-Token (device TBA)	same provider-session flow
nnmclub	FORM_LOGIN	login 401 (Turnstile)	external block - Cloudflare Turnstile (honeypot, not a code bug)
archiveorg	NONE	502	IPv4-only upstream stalls through Mullvad VPN egress (per-destination routing needed)
yts	NONE	502	same egress class
thepiratebay	NONE	502	same egress class
tokyotosho	NONE	502	same egress class
nyaa	NONE	502	DPI-blocked on direct; needs VPN (opposite of archiveorg)
torrentscsv	NONE	502	egress

Provider	Auth	/v1/{p}/search status	Root cause
bitsearch	NONE	502	egress
knaben	NONE	502	egress

Key derivation verified: `base64(rawUUIDBytes)` of first LAVA_AUTH_ACTIVE_CLIENTS UUID → gutenber 200 confirms the Lava-Auth middleware accepts it.

Device matrix (goapi, containerized KVM emulator, API 34):
in progress — rutracker×1080p = PASS clean
(marker_download_ok=true, real result id=6867145, video recorded). Remaining cells running.

Operator symptom classification (working hypothesis, evidence-pending)

"Search does not work, never get any results" — CONFIRMED (goapi probe table above): the 502-egress provider set (archiveorg/yts/thepiratebay/tokyotosho/nyaa/torrentscsv/bitsearch/knaben) returns no rows through the containerized goapi's VPN egress, while rutracker/kinozal/gutenberg return results. UNCONFIRMED: which providers the operator's specific failing search targeted (pending the operator's provider selection at report time). The fix is per-destination egress routing (operator-infra decision per CONTINUATION 2026-07-02), NOT a parser patch and NOT a global bypass (a global bypass breaks rutracker/kinozal which need the VPN exit-IP).
