

Chaos-Stress Docs — Markdown Export Sibling Audit (§11.4.65)

Status: Audit complete — recommendation: **§6.AF-debt** (do NOT generate a sibling pile this cycle) **Constitution:** §11.4.65 (CONST-066 universal-markdown-export) · §11.4.61/64 (metadata table + ToC) · §6.U (no sudo) · §6.T.2 (resource limits) · §11.4.6 (no-guessing) **Last updated:** 2026-05-31 **Owner:** docs-export audit subagent (read-only git; no commit/push) **Scope:** the NEW markdown docs added in the last ~10 commits OUTSIDE docs/tickets/, docs/CODEGRAPH.md, .codegraph/, constitution/

1. Export-tooling reality

Probe	Result (CONFIRMED)
command -v pandoc	PRESENT — /opt/homebrew/bin/pandoc (pandoc 3.9.0.2)
command -v weasyprint	PRESENT — /opt/homebrew/bin/weasyprint (WeasyPrint 66.0)
scripts/testing/ sync_all_markdown_exports.sh	ABSENT — no canonical Lava export script
Any scripts/*export* / scripts/*markdown*sync*	NONE (full-tree find)
Lava tracked files referencing weasyprint/pandoc	scripts/build-stats-report.sh only — that is the §11.4.24 build-stats report renderer , NOT a doc-sibling export tool
Constitution submodule (constitution/, pin 883ccc1)	HAS §11.4.65 (Constitution.md L100 ToC entry + §11.4.65 body) AND ships its own export triples: every governance doc (Constitution, CLAUDE, AGENTS, QWEN, README, submodules-catalogue) exists as .md + .html + .pdf + .docx at the submodule root
Constitution committed export <i>script</i>	constitution/scripts/ contains only codegraph_sync.sh,

Probe	Result (CONFIRMED)
	codegraph_update.sh, workable-items/ — no committed markdown-export script is visible in the pinned tree; the constitution's .html/.pdf/.docx triples appear to be produced by an upstream-internal tool not vendored into the submodule

Conclusion:

- The **toolchain to generate siblings exists on this host** (pandoc + weasyprint) — generate-now is *physically feasible*, contrary to a no-tooling blocker.
- But **Lava itself has no committed Markdown→HTML/PDF export mechanism**: no sync_all_markdown_exports.sh, no delegation wrapper to the constitution submodule, and the only weasyprint consumer is the build-stats renderer (a different §11.4.24 concern).
- The constitution submodule **demonstrates the §11.4.65 convention** (it keeps its own doc triples in sync) but does **not export a reusable script** into the pinned tree that Lava could invoke.

2. Is §11.4.65 ENFORCED in Lava today?

NO. Evidence:

- scripts/verify-all-constitution-rules.sh — no CM-UNIVERSAL-MARKDOWN-EXPORT-SYNC gate; no reference to markdown, export, sibling, .html, .pdf, or 11.4.65.
- scripts/check-constitution.sh — no markdown-export gate.
- CLAUDE.md — §6.AF exists but covers **HelixConstitution §11.4.79-106 adoption** (constitution pin bump + LVA tickets + chaos-stress); it does **not** wire §11.4.65 universal-markdown-export. §6.AF-debt enumerates owed items but markdown-export-sync is not among them.

§11.4.65 is inherited (binding by transitive reference per §6.AD.8) but **un-wired as a project-side gate** — the same posture as the other un-implemented CM-* gates tracked under §6.AD-debt.

3. Per-doc sibling status (in-scope NEW docs)

Doc (repo-relative)	.md	.html	.pdf	§11.4.61 metadata	ToC
docs/chaos-stress/DESIGN.md	Y (14353B)	N	N	bold key:value header block (not pipe-table)	numbered ## sections, no explicit ToC list
docs/chaos-stress/EVIDENCE-phase1.md	Y (4548B)	N	N	partial	none
docs/scripts/run-chaos-stress.sh.md	Y (2202B)	N	N	script- companion free-form	n/a (short)
docs/scripts/check-lva-tickets.sh.md	Y (4661B)	N	N	script- companion free-form	n/a (short)
lava-api-go/tests/NEW-TESTS-EVIDENCE.md	Y (9250B)	N	N	evidence free-form	none

Correction to the task's premise: the task said the 3 ad-hoc PDFs / commit 85a4a7f5 exist — **they do not**. There are **zero** .html and **zero** .pdf siblings for any in-scope doc. (git show 85a4a7f5 returned no such commit; the only *.pdf/*.html doc siblings in the tree are under docs/tickets/export/ — another stream's domain, out of scope — and the constitution submodule root.) lava-api-go/tests/NEW-TESTS-EVIDENCE.md DOES exist (9250B), contrary to the task's "may not exist" note.

Other NEW .md in the last 10 commits, outside excluded paths (no siblings either, noted for completeness, NOT in this task's generate-scope): docs/scripts/lava-tickets.md, docs/scripts/verify-codegraph.sh.md, docs/superpowers/specs/2026-05-20-codegraph-incorporation-design.md, QWEN.md, lava-api-go/QWEN.md, lava-api-go/tests/stress/README.md, tests/check-lva-tickets/EVIDENCE.md, .lava-ci-evidence/constitution-review/2026-05-31-68th-cycle-review.md.

4. Recommendation — §6.AF-debt (NOT generate-now)

Record §11.4.65 universal-markdown-export enforcement as §6.AF-debt; do NOT hand-generate siblings for these docs this cycle. The toolchain exists, so this is a *policy* recommendation, not a *capability* blocker:

1. **No convention to be consistent with.** Lava has no export script and no §11.4.65 gate. Hand-running pandoc on 5 docs now creates artifacts with **nothing to keep them in sync** — the next .md edit silently desyncs the .html/.pdf, which is exactly the green-looking-but-stale bluff class the Anti-Bluff Pact (§6.J/§6.L) exists to prevent. A maintained sibling needs a re-sync gate; an unmaintained one is worse than none.
2. **Partial coverage is misleading.** If §11.4.65 binds, it binds for **all** non-source docs (the §3 list is ~13 files, plus the broader tree). Generating siblings for just the 5 chaos-stress docs implies a convention that the other 8+ NEW docs (and the entire pre-existing docs/ tree) violate — making the repo *look* partially-compliant while being uniformly non-enforced.
3. **Metadata/ToC is non-conformant.** None of the 5 docs carry a §11.4.61 pipe-table metadata block or explicit ToC. Generating HTML/PDF from non-conformant source bakes the non-conformance into the rendered artifacts; the right fix normalizes source first, then renders once.
4. **The constitution shows the right pattern.** The submodule keeps .md+.html+.pdf+.docx in lockstep via a real (upstream-internal) tool. Lava should mirror that with a committed scripts/testing/sync_all_markdown_exports.sh (pandoc --standalone HTML + --pdf-engine=weasyprint PDF), wire a gate, then backfill **all** docs in one pass — a dedicated phase, not a 5-file side effect of the chaos-stress cycle.

Suggested §6.AF-debt addendum for CLAUDE.md (for the main agent to consider)

§6.AF-debt addendum — §11.4.65 universal Markdown export sync (2026-05-31). §11.4.65 (CONST-066) is inherited but un-wired in Lava: no scripts/testing/sync_all_markdown_exports.sh, no CM-UNIVERSAL-MARKDOWN-EXPORT-SYNC gate in scripts/verify-all-constitution-rules.sh. pandoc 3.9 + weasyprint 66 ARE installed on the operator host; the constitution submodule keeps its own .md/.html/.pdf/.docx triples in sync as the reference pattern. No in-scope docs/ doc currently has .html/.pdf siblings (the docs/tickets/export/ triples belong to the tickets stream). Closure owes: (1) a canonical Lava export script; (2) verify-all gate wiring; (3) one consistent sibling backfill across all

non-source docs incl. §11.4.61 pipe-table metadata + ToC normalization. Until close, markdown-export sync is operator-and-reviewer-verified manually.

5. Files for git add (this cycle)

Only this audit file — no generated siblings (recommend §6.AF-debt over hand-generation):

- docs/chaos-stress/EXPORT-AUDIT.md
