

record-challenge-video.sh

Records + validates ONE Compose UI Challenge on the Genymotion VM and delivers the SUCCESS video to the operator's home dir.

Script: scripts/record-challenge-video.sh

What it does (thin glue, \$6.AH VM path, \$6.U no-sudo)

1. Resolves the Genymotion VM adb serial via the Containers submodule cmd/genymotion CLI (\$6.AG — the VM is an authorized non-host-direct surface per \$6.AH; NEVER a live/physical ADB device).
2. Starts screenrecord on the VM, runs the named Challenge via connectedDebugAndroidTest, stops the recording.
3. On a PASSing Challenge, pulls the recording and delivers it to the operator's home dir (\$HOME / \$HOME/Downloads). Only PASS videos are delivered (a failing Challenge's recording is not presented as success — \$6.J).

Usage

./scripts/record-challenge-video.sh <ChallengeNN_Name>

Constitutional bindings

\$6.AH (VM/container emulator, never host-direct), \$6.AG (Containers-driven device resolution), \$6.U (no sudo), \$6.J (only real PASS videos delivered), \$11.4.128 (device-recording discipline).
