

Phase 3 — First-Run Onboarding Wizard Design

Date: 2026-05-07 **Status:** Approved (post-brainstorm) **Parent decomposition:** Phase 3 of 6 (see docs/CONTINUATION.md §4.2)
Constitutional bindings: §6.J, §6.L, §6.R, §6.Q, §6.S, §7

1. Problem Statement

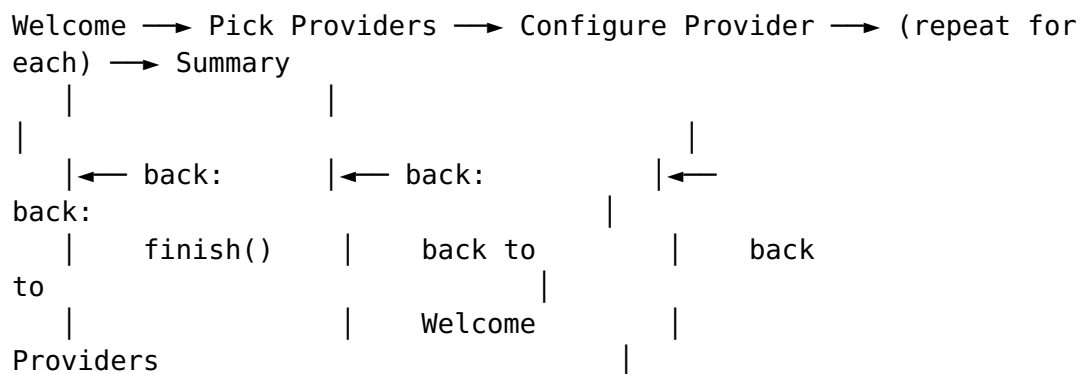

The current onboarding is a single flat screen (OnboardingScreen wrapping ProviderLoginScreen). Users pick one provider, configure it, and proceed. There is no multi-step wizard, no connection testing per provider, and no summary step. The operator's TODO says: "Leaving wizard without configured providers should close the app" and "user **MUST** execute connection tests with provided credentials with success."

Phase 3 builds a proper multi-step onboarding wizard: welcome → pick providers → configure each → summary.

2. Design Decisions (from brainstorm)

Decision	Choice	Rationale
Wizard layout	Single screen with phased content	One ViewModel, AnimatedContent transitions. Cleaner for repeated per-provider config steps.
Provider requirement	Close app on back press	finish() at welcome step. Operator spec: "Leaving wizard without configured providers should close the app."
Connection test	Auto-test on credential submit	Spinner + auto-advance on success, error + retry on failure. No separate test step.

3. Wizard Step Flow

Step 1: Welcome

- Brief intro: "Welcome to Lava. Let's set up your content providers."
- Shows provider count: "6 providers available"
- Single "Get Started" button → advances to Providers

Step 2: Pick Providers

- Checklist of all apiSupported && verified providers (6 today)
- Each item: provider name, auth type badge (Form Login / Anonymous), color dot
- Multi-select: user can pick any combination
- "Next" enabled when ≥ 1 provider selected
- Pre-selected: all 6 providers checked by default

Step 3: Configure Provider (repeated per selected provider)

- **Anonymous path** (AuthType.NONE): shows provider name + "Continue as Anonymous" button. Tapping it runs health check, on success advances. No credential form.
- **Auth path**: username + password fields (reuse LoginScreenCommon components). "Test & Continue" button.
- **Auto-test**: button tap triggers sdk.checkAuth() or sdk.healthCheck(). Shows spinner "Testing connection to RuTracker...". On success auto-advances. On failure shows error + retry.

Step 4: Summary

- "All set!" header
 - List of connected providers with green checkmarks
 - "Start Exploring" button → writes onboardingComplete = true, signals auth for each provider, exits to main screen
-

4. State Model

```
data class OnboardingState(  
    val step: OnboardingStep = OnboardingStep.Welcome,  
    val availableProviders: List<ProviderOnboardingItem> =  
        emptyList(),  
    val selectedProviderIds: Set<String> = emptySet(),  
    val currentProviderIndex: Int = 0,  
    val providerConfigs: Map<String, ProviderConfigState> =  
        emptyMap(),  
    val connectionTestRunning: Boolean = false,  
    val connectionTestError: String? = null,  
)
```

Where:

- OnboardingStep: enum Welcome, Providers, Configure, Summary
 - ProviderOnboardingItem: wraps TrackerDescriptor with selection state
 - ProviderConfigState: per-provider auth fields + test status
-

5. Architecture

New module: feature:onboarding

```
feature/onboarding/  
├─ src/main/kotlin/lava/onboarding/  
│   └─ OnboardingScreen.kt          # Main composable with  
AnimatedContent  
│   └─ OnboardingViewModel.kt      # @HiltViewModel, Orbit MVI  
│   └─ OnboardingState.kt          # State + step enum  
│   └─ OnboardingAction.kt         # Actions: NextStep, BackStep,  
SelectProvider, ...  
│   └─ OnboardingSideEffect.kt     # Side effects: Finish,  
ShowError  
│       └─ steps/  
│           └─ WelcomeStep.kt      # Welcome screen composable  
│           └─ ProvidersStep.kt    # Provider selection list  
│           └─ ConfigureStep.kt    # Per-provider credential form  
│           └─ SummaryStep.kt      # Completion summary  
│       └─ navigation/  
│           └─ OnboardingNavigation.kt # Navigation extension for  
MainActivity
```

Changes to existing modules:

- **:app**: Replace OnboardingScreen usage in MainActivity.kt with new feature:onboarding composable

- **:feature:login:** Deprecate OnboardingScreen.kt (thin wrapper, no longer needed)
- **settings.gradle.kts:** Register :feature:onboarding

No changes needed:

- ProviderLoginViewModel + ProviderLoginScreen — kept for Settings → Credentials flow (post-onboarding credential editing)
 - core/preferences — isOnboardingComplete() flag reused
 - core/auth — signalAuthorized() reused for each provider
-

6. Connection Test Logic

For AuthType.NONE providers:

1. Call provider.HealthCheck() via Go API
2. 200 → advance. Error → show "Cannot reach Archive.org. Check your network."

For auth-requiring providers:

1. Call sdk.login(providerId, username, password)
 2. Success → save credentials → advance
 3. Wrong credentials → "Invalid username or password. Try again."
 4. Network error → "Cannot reach NNM-Club. Check your network and try again."
-

7. Back Press Behavior

Current step	Back press action
Welcome	finish() — close the app
Providers	Go back to Welcome (which then closes on next back)
Configure	Go back to Providers (deselect current provider if config not committed)
Summary	Ignored — user must tap "Start Exploring"

8. Files Affected

New files:

File	Responsibility
feature/onboarding/build.gradle.kts	Module config
feature/onboarding/src/main/.../ OnboardingScreen.kt	Main wizard composable
feature/onboarding/src/main/.../ OnboardingViewModel.kt	Step orchestration, connection testing
feature/onboarding/src/main/.../ OnboardingState.kt	State + step enum
feature/onboarding/src/main/.../ OnboardingAction.kt	User actions
feature/onboarding/src/main/.../ OnboardingSideEffect.kt	One-time effects
feature/onboarding/src/main/.../ steps/WelcomeStep.kt	Welcome UI
feature/onboarding/src/main/.../ steps/ProvidersStep.kt	Provider picker
feature/onboarding/src/main/.../ steps/ConfigureStep.kt	Credential form
feature/onboarding/src/main/.../ steps/SummaryStep.kt	Completion summary

Modified files:

File	Change
settings.gradle.kts	Add :feature:onboarding
app/.../MainActivity.kt	Replace OnboardingScreen with new wizard
feature/onboarding/src/main/ AndroidManifest.xml	Standard manifest

9. Testing Strategy

Test	Type	Location
OnboardingViewModelTest	Unit	feature/onboarding/src/ test/ — step transitions, provider selection, back press behavior

Test	Type	Location
OnboardingStepsTest	Structure	feature/onboarding/src/test/ — Compose layout regressions per §6.Q
Challenge C20	Compose UI	app/src/androidTest/ — full wizard flow: Welcome → pick providers → configure → finish → verify main screen appears
Challenge C21	Compose UI	app/src/androidTest/ — back press at Welcome closes app
Challenge C22	Compose UI	app/src/androidTest/ — anonymous provider: pick Archive.org → Continue → auto-advances

10. Visual Style

- **Welcome step:** Centered logo/text, large "Get Started" button
- **Providers step:** Cards with checkbox, colored provider dot, auth type badge (AssistChip), Anonymous toggle if supported
- **Configure step:** Clean form with provider color header, LoginScreenCommon fields, full-width "Test & Continue" button with built-in spinner
- **Summary step:** Green checkmark list, "Start Exploring" CTA button
- **Transitions:** AnimatedContent with fadeIn + slideInHorizontally / fadeOut + slideOutHorizontally

All visual decisions auto-approved per operator directive.
