

Background-Work Queue

Durable record of BACKGROUND ::-prefixed operator requests, per §11.4.140 and the durability composition (§11.4.87 / §11.4.94 / §11.4.97 / §11.4.103 / §11.4.126).

A request recorded here MUST reach a terminal state (done or operator-cancelled). Silently dropping one, or deferring-and-forgetting it, is forbidden. A request that is BLOCKED stays QUEUED with its blocker named, is re-attempted at the next opportunity — including in a fresh session — and is re-surfaced to the operator every session until terminal.

id	received	status	request	blocker
BG-001	2026-08-27	done	Go through all operator-blocked items, blockers and show-stoppers; put them to the operator as interactive questions with options so everything can be unblocked.	none — executed the same turn it was received
BG-002	2026-09-19	done	Verify + strengthen (as needed) the constitution submodule's + every inherited Lava governance file's coverage of: mandatory all-supported-test-types creation, machine-produced rock-solid deterministic evidence for every test/product result, zero tolerance for guessing/prediction/AI-slop/bluff of any kind, full incorporation-through-inheritance of every constitution sub-submodule into every consuming project, and a standing zero-defect/zero-gap/zero-weak-spot bar tracked+fixed+validated+verified	none — audit complete, zero genuine textual gaps found; see docs/requests/BG-002-audit-report.md

id	received	status	request	blocker
			fully deterministically on an ongoing basis.	

BG-002 — detail

Received: 2026-09-19, mid-session, while `scripts/commit-push-all.sh` was mid-retry on an unrelated §6.AC gate failure (the orchestrating session's live push work).

Verbatim operator request (typos preserved): "CRITICAL: Make sure that the following rules and mandatory constraints exist and that they are dominant in root constotution (constitution Submodule) and all critical files we are ingeriting from constitution Submodule ---> We MUST ALWAYS create all supported test types. All tests MUST PRODUCE machine rock-solid evidence! All results produced (tests and produts itself) MUST BE heavily validated and verified fully deterninistically! There MUST BE NO guessing or predication, only phisical rock-solid evidences fully deterministically proven! Any false or faulty results are forbiddeb or having AI slop or bluff of any kind or any form anywhere!!! We MUST BE sure that all Submodules under constitution Submodule are fully incorporated into every project through use and inheritance of constitution Submodule anf that they do guranatee impeccable and pixel perfext zero-defect quality and stabikity of the product! There MUST BE ALWAYS ZERO defects, gaps, shortcomings, unfinished work, untested parts, weak spots or dnager zones in any module or part of the codebase! This all MUST BE regularly tracked, fixed, polished, tvalidated and vwrified FULLY DETWERMINISTICALLY!!! Fan out subagents!"

Scope as dispatched: a read-first audit (not blind editing) of `constitution/CLAUDE.md`

- `constitution/Constitution.md` for existing coverage of: (a) mandatory all-test-type creation, (b) machine-produced deterministic evidence requirements, (c) anti-guessing / anti-bluff / anti-AI-slop prohibitions, (d) constitution-sub-submodule full-inheritance mandates, (e) a standing zero-defect/zero-gap bar with ongoing tracking. Given this project's own extensive Anti-Bluff Pact (§6.A–§6.AL) and the constitution's own §11.4 anti-bluff covenant already cover most of this ground in depth, the dispatched task is to report GAP-FIRST — cite the exact existing anchors that already satisfy each demand, and flag ONLY genuine gaps rather than

duplicating existing coverage or inventing new absolute/impossible standards (a literal "always zero defects" is not a verifiable engineering claim; the existing anchors already frame this correctly as evidence-gated/falsifiable rather than as an unfalsifiable absolute) — consistent with §11.4.6 no-guessing and this project's own honesty-over-bluff standard, which this very request is asking to reinforce.

Terminal state: reached 2026-09-19. The dispatched subagent's audit found ZERO genuine textual gaps — all five demands are already covered by existing HelixConstitution anchors: (a) §11.4.169 + §11.4.224 (all-test-types + TDD/coverage floor), (b) §11.4.262 + supporting chain (machine-created evidence at every gate), (c) §11.4.6 (a near-verbatim match — the no-guessing vocabulary discipline), (d) §11.4.28(C)/ §11.4.106/§11.4.207/ §11.4.196(F) (rule-level forbids configured-but-unused submodules as a bluff) — though the audit also found, and reported honestly rather than papering over, that this specific sub-point is PARTIALLY-COVERED in practice: none of constitution's 7 nested engines (anti_bluff, continuum, design-toolkit, docs_chain, helix_perf_cache, session_orchestrator, token_optimizer) are actually invoked anywhere in Lava's own scripts today — pinned transitively but dormant, a real compliance backlog rather than a missing rule (the existing rule already forbids exactly this failure mode; see §11.4.227's own admission that 58% of named gates are corpus-wide unimplemented) — and (e) §11.4.261 (a monotone-decreasing audit ratchet against a closed, extensible finding vocabulary — the honest/falsifiable framing, not the literal impossible-absolute the operator's own wording reached for). No new constitution anchors were proposed or written — doing so over already-extensive, near-verbatim-matching coverage would itself be the bureaucratic-bloat/duplicate-bluff this governance system exists to prevent. Full citations and the sub-submodule incorporation table are in docs/requests/BG-002-audit-report.md.

BG-001 — detail

Received: 2026-08-27, mid-session, while three subagents were clearing pre-push blockers and the parent repo sat committed-but-unpushed at 38986527.

Scope as executed: every item the workable-items tracker records as Operator-blocked (4), plus every P0 in Queued / In progress that cannot advance without an operator decision, plus the live push blockers

discovered by the pre-push hook. Compiled from the tracker DB directly rather than from memory, so nothing recorded could be omitted by recall.

Terminal state: the questions were put to the operator in the same turn the request arrived. Answers and their consequences are recorded against the individual LVA items, not here — this file records only that the request existed and was discharged.
