

Phase-2 1337x via FlareSolvrr — live solve result (2026-06-13)

Operator authorized the FlareSolvrr/Chromium dependency ("all 3"). The FlareSolvrr Go client (internal/provider/flaresolvrr/) is built + unit-tested

- pushed (60969640). The remaining question for a 1337x curated provider: can FlareSolvrr actually SOLVE 1337x's Cloudflare challenge so the provider can fetch real results?

Decisive live test (real, on this host)

FlareSolvrr ghcr.io/flaresolvrr/flaresolvrr:latest brought up on podman (container lava-flaresolvrr, port 8191).

Probe	Result
request.get https://1337x.to/search/ubuntu/1/ (maxTimeout 75s)	status: error — "Error solving the challenge. Timeout after 75.0 seconds" ; solution.status none; 0 bytes HTML
CONTROL: request.get https://example.com/ (non-CF)	status: ok, solution.status 200, 544 bytes HTML, 8.1s

The control proves FlareSolvrr itself is functional on this host. The 1337x failure is specifically **1337x's current Cloudflare challenge is NOT solvable by this FlareSolvrr build** (it times out at 75s while a non-CF page solves in 8s).

Honest verdict

1337x CANNOT be shipped as a working curated provider right now. A provider whose only fetch path times out on every request would be a \$6.E/\$6.L bluff (a provider that can't actually return results). Per the anti-bluff mandate, it is NOT added.

- The FlareSolvrr seam (Go client) is DONE + tested + reusable — ready for a CF-gated provider the moment FlareSolvrr can solve that site (a newer FlareSolvrr build, a different CF-gated tracker, or 1337x if its challenge becomes solvable).
- 1337x itself: BLOCKED at the CF-solve layer (FlareSolvrr-vs-current-1337x-CF limitation, NOT a code gap). Re-test periodically; do not ship until a real solve returns a parseable results page.

The 12 shipped curated/native providers (all live-reachable, see `.lava-ci-evidence/curated-live-reachability/2026-06-13-audit.md`) remain the honest, working provider set.

Container torn down after the test (\$6.M host hygiene — no idle Chromium).
