

scripts/autonomous-qa/lib-summary.sh — User Guide

Last verified: 2026-07-26 (LVA-018 script-docs backfill cycle)

Inheritance: HelixConstitution §11.4.18 (script docs); Lava §6.J
(unknown verdict = FAIL) **Classification:** project-specific

Overview

Pure, sourceable helpers for aggregating the per-iteration `verdict.json` files (written by `run-iteration.sh`) into the matrix `summary.md`. Kept side-effect-free so they can be unit-tested in isolation — see `tests/autonomous-qa/test_run_matrix_verdict_parse.sh`.

Why it exists (historical bug)

The inline extraction it replaced anchored the value with `grep -oE '[A-Z]+$'`, but the `grep -o` match `"verdict": "PASS"` ends in a double-quote, so `[A-Z]+$` never matched → the pipeline failed → the `|| echo FAIL` fallback fired on EVERY row, mislabelling genuine PASS/SKIP iterations as FAIL in the matrix totals. These helpers are the fixed, test-covered extraction path.

Functions

qa_parse_field <file> <key>

Extract the value of a top-level <key> from a flat `verdict.json` object. Handles the two value shapes `run-iteration.sh` emits:

- quoted ALL-CAPS string — `"verdict": "PASS"`
- bare integer — `"tests": 5`

Prints the value and returns 0 on success; prints nothing and returns 1 when the file is missing or the key has no parseable value (the caller then applies its own `|| echo FAIL / || echo 0 fallback`).

qa_classify <verdict>

Map a raw verdict token to its summary bucket:

Token	Bucket
PASS	PASS
SKIP	SKIP
anything else	FAIL (defensive — an unknown/garbled verdict is a failure, never a silent pass)

Usage

```
source scripts/autonomous-qa/lib-summary.sh
v="$(qa_parse_field "$evid/verdict.json" verdict || echo FAIL)"
t="$(qa_parse_field "$evid/verdict.json" tests || echo 0)"
case "$(qa_classify "$v")" in PASS) ... ;; SKIP) ... ;; *) ... ;; esac
```

Hermetic test

`tests/autonomous-qa/test_run_matrix_verdict_parse.sh` — exercises both value shapes, the missing-file/missing-key returns, and the classification table.

Companion files
