

HelixQA own-org dependency submodules

Created 2026-06-08 per operator directive: "we *MUST ADD* all missing dependency Submodules which can be added from vasic-digital and HelixDevelopment orgs! Document this in project so we are aware of this fact!"

Why this exists

HelixQA (submodules/helixqa, Go module `digital.vasic.helixqa`) is the autonomous-QA framework the operator wants running per-provider QA sessions against the Lava app. Its `go.mod` **replace directives point at sibling paths** (`../X`) that resolve, when HelixQA is mounted under submodules/helixqa, to **submodules/X** in the Lava tree. HelixQA does **not** carry these own-org deps in its own `.gitmodules` — it expects the **consuming project (Lava) to provide them as sibling submodules**. Until they are present, `go build ./cmd/helixqa` fails ("reading ../doc_processor/go.mod: no such file or directory"), and because `lava-api-go` does `replace digital.vasic.helixqa => ../submodules/helixqa`, a broken/missing HelixQA dep tree can break the Lava Go build too.

The 8 own-org (`digital.vasic.*`) sibling modules HelixQA requires

Source of truth: submodules/helixqa/go.mod replace block.

Go module	sibling path (Lava)	vasic-digital repo	status
<code>digital.vasic.challenges</code>	<code>submodules/challenges</code>	<code>challenges</code>	already present
<code>digital.vasic.containers</code>	<code>submodules/containers</code>	<code>containers</code>	already present

Go module	sibling path (Lava)	vasic-digital repo	status
digital.vasic.security	submodules/ security	security	already present
digital.vasic.docprocessor	submodules/ doc_processor	DocProcessor	+ added 2026-06-08
digital.vasic.llmorchestrator	submodules/ llm_orchestrator	LLMOrchestrator	added 2026-06-08
digital.vasic.llmprovider	submodules/ llm_provider	LLMProvider	added 2026-06-08
digital.vasic.llmsverifier	submodules/ llms_verifier (module in /llm- verifier)	LLMsVerifier	+ added 2026-06-08
digital.vasic.visionengine	submodules/ vision_engine	VisionEngine	added 2026-06-08

All 5 new ones were added from `git@github.com:vasic-digital/<Repo>.git` (the same org + SSH scheme as the existing 3). Local paths are snake_case to match HelixQA's replace targets exactly.

NOT added (deliberately out of scope)

HelixQA's own .gitmodules lists **dozens of third-party tools/opensource/* submodules** (scrcpy, appium, chroma, perfetto, ui-tars, moondream, mem0, leakcanary, docker-android, midscene, marker, unstructured, signoz, redroid, ...). These are **third-party** repos (Genymobile, bytedance, google, square, etc.), **not** vasic-digital / HelixDevelopment, so they are explicitly **excluded** from this addition per the operator's "from vasic-digital and HelixDevelopment orgs" scope. They are runtime tools the full autonomous binary may need; provisioning them is a separate, later task (`git -C submodules/helixqa submodule update --init <path>` for the specific tools actually required at run time).

Pin policy

Per the §6.AD Q9 waiver, the HelixQA ecosystem tracks upstream. The HelixQA pin itself was bumped 5112906 → dd3cf1d on 2026-06-08 to escape a broken pinned commit whose `go.mod` contained **unresolved git conflict markers** (L124/131/138) that broke the Go build. The 5 new sibling submodules were added at their current upstream HEAD; record their pins in `docs/CONTINUATION.md` §3.

Verification owed

`cd submodules/helixqa && go build ./cmd/helixqa` succeeds (or surfaces the next missing own-org dep — repeat the add until only third-party `tools/opensource/*` remain).

`cd lava-api-go && go build ./...` still green (confirmed green after the pin bump).

§6.W: ensure each new submodule mirrors to GitHub **and** GitLab (own-org mirror mandate).
